

SnapVerify

Turning screenshots into trusted digital evidence.

SnapVerify is a web platform that makes screenshots and digital files verifiable, tamper-evident, and trustworthy.

It replaces blind trust with proof—through context locking and public verification.

College Name – Dcrust.

The Actual Problem

India has gone digital

But digital proof has not.

Everyday decisions depend on screenshots, PDFs, and chat forwards

These are treated as “proof” for:

- Payments
- Academic records
- Job offers & approvals
- Business commitments

Screenshots are:

- Easy to edit or fabricate
- Impossible to verify independently

This leads to:

- Trust failures
- Disputes and delays
- Loss of time, money, and credibility

There is no standard system to verify one basic question:

“Did this digital event actually happen?”

This is not a technology problem.
It is a missing digital evidence infrastructure.

Our Solution

SnapVerify- From Screenshot to Evidence

Proposed Solution

SnapVerify turns screenshots and digital files into trusted digital evidence.
Each proof is time-stamped, locked to its context, and instantly verifiable via a public link.

How It Addresses the Problem

- Screenshots become verifiable proof
- Tampering is instantly detectable
- Anyone can verify, no trust required
- Disputes reduce before they start

Core Capabilities

- 1.Context-locked proof creation
- 2.Tamper & integrity detection
- 3.Public, no-login verification links

Unique Value Proposition

Screenshots →
Evidence

Trust without
intermediaries

Faster,
dispute-free
decisions

Standard for
digital proof

Objective & Prototype

Prototype Overview

SnapVerify is a web-based prototype that converts digital artefacts such as screenshots, PDFs, and receipts into verifiable digital evidence.

The prototype allows users to upload proof, lock its context, and generate a public verification link that enables anyone to independently check authenticity and integrity.

Key Objectives of our Prototype

- Identify high-risk contract clauses early
- Prevent financial and career-related losses
- Simplify complex legal language for users
- Provide fast, reliable pre-signing risk assessment
- Make contract safety accessible and affordable

Proposed System Workflow for Infrastructure Management

Technical Approach

Frontend

- Html + JS – User interface & proof dashboard
- Bootstrap– Clean, fast, responsive UI

Backend

- Node.js + Express – API & proof processing
- MongoDB – Proof records & metadata storage

Verification & Security

- SHA-256 Hashing – File integrity check
- Server-side Timestamping – Proof creation time
- Read-only Proof Access – No modification after upload

AI / Intelligence

- OCR & Metadata Analysis – Content consistency
- Used for analysis, not decision-making

Approach

1. Proof Input

User uploads screenshot / file with purpose

2. Context Lock

Proof intent & details locked permanently

3. Integrity Check

File fingerprint & tamper detection

4. Evidence Analysis

Metadata & content consistency check

5. Proof Registration

Server timestamp
immutable record

6. Public Verification

Shareable proof link
– trusted decision

Feasibility

FEASIBILITY

Technical

- Pure web-based system
- Proven cryptographic hashing
- Scalable cloud architecture

Implementation

- Working prototype in hackathon scope
- Simple upload → verify → share flow
- No hardware or IoT dependency

Operational

- Extremely easy for users
- No change in existing workflows
- Works with files people already use

Business

- Reduces disputes & verification cost
- Applicable across sectors
- Strong adoption & monetization potential

CHALLENGES

- Building initial user trust in a new digital proof system
- Handling multiple file types and varying screenshot quality
- Preventing misuse or misinterpretation of shared proof links
- Ensuring accuracy of tamper and integrity checks
- Aligning the system with future legal and institutional standards

STRATEGIES

- Use clear evidence confidence indicators instead of binary claims
- Apply context locking and read-only verification to avoid misuse
- Standardize file processing and validation pipelines
- Maintain transparent verification logic for auditability
- Design the platform to align with evolving legal and policy frameworks

Unique Innovation

Traditional Approach

Our Innovation

Positive outcomes

Digital Proof Approach

Screenshots, PDFs, and chat forwards used as informal proof.

Screenshots converted into structured, verifiable digital evidence.

- ✓ Trusted digital evidence
- ✓ No reliance on screenshots

Use of Technology

No verification layer; relies on human trust and assumptions.

Automated integrity checks with context locking and timestamps.

- ✓ Automated verification
- ✓ No manual assumptions

Verification Method

Manual checking with no way to detect tampering.

Public, tamper-evident verification through shareable proof links.

- ✓ Tamper-evident proof
- ✓ Transparent validation

Dispute Handling

Issues resolved after conflict through long manual processes.

Disputes prevented upfront through transparent verification.

- ✓ Fewer conflicts
- ✓ Faster resolutions

Scalability & Trust

No standard system; trust varies across people and institutions.

Standardized digital proof layer usable across domains.

- ✓ Standardized across domains
- ✓ National-scale adoption
